PROJECT OVERVIEW

The main objective of this project is to build a study material application which will ease a community to easily access & find out the required documents They can find the essential notes here, write remarks, and operate as Editor.

Home Page

There are options to register and log in. If a user doesn't register their name and ID, they cannot login. When registering, there are two possibilities. Either they may register as a user who will be able to read all the documents and leave comments, or they can register as an editor who will have full access to upload, view, and remove documents.

Editor

They must register as Editors in order to become editors. Following registration, their information will be recorded in a MySQL table with the name "unapproval." The owner of the app or the other editors can choose to authorize the editors list so they can easily upload, view, and remove documents.

User

One can sign up to become a user. They are able to view and comment on the files.

Material

All the documents are arranged in the material section according to the courses for each level.

Editor Homepage

Editor home page will be displayed if editor is logged in. Three options are available on the editor homepage: upload, approve editor, and comment.

Upload

Editors can upload all of their documents using this option.

Approve Editor

We can view the entire list of editors in this section.

Comment

Users can comment on their problems in this section.

MySQL database

We have used this database to separate the usage of an editor and a user as well as to store all the login information.
